

AT A GLANCE PANORAMA

The term network security has become synonymous with complex network architecture, as well as administrative nightmares and increased threat exposure. A multitude of security point deployments, diverse management consoles, and complex and outdated security policies spread across multiple rule bases makes it nearly impossible to effectively manage these networks. Many organizations have accepted this management nightmare as the status quo and think improvement of this situation is not possible. Panorama™ network security management empowers you with easy-to-implement, consolidated policy creation and management. Set up and control next-generation firewalls centrally with industry-leading functionality and an efficient rule base, and gain insight into network-wide threats.

Panorama — More Than Just Central Management

Panorama reduces network complexity with logical, functional device groups, simplifies network management with easy, global policy control, and reduces the time that threats linger on your network with actionable data highlighting critical information for response prioritization. Leading automated threat correlation enables users to detect advanced threats that would otherwise go unnoticed by connecting the dots between indicators of compromise (IoCs) across your entire network.

Panorama offers the same look and feel as any Palo Alto Networks® Next-Generation Firewall management interface. With no additional user interfaces required, you will be up and running with Panorama in no time. In fact, the Application Command Center (ACC) within Panorama presents all network and threat information across the entire network in customizable, meaningful and actionable dashboards.

Panorama Highlights

- Intuitive and powerful policy control with a single security rule base
- Enterprise-class management capabilities, hierarchical device groups, template stacks and more
- Actionable insight into traffic and threats with the powerful Application Command Center (ACC)
- Scalable and flexible deployment options
- Aggregated logging and event correlation across next-generation firewall and Traps™ advanced endpoint protection

AT A GLANCE PANORAMA

YOU NEED	WE OFFER
Reduced management complexity	Panorama offers simplified management, rule setting and consolidated reporting for your entire network of next-generation firewalls. Control your network from a central location while reducing your reliance on local management and the complexity of your network of local system administrators. The user interface looks and feels like the next-generation firewall user interfaces you are used to from Palo Alto Networks.
Simplified rule base	Manage your network with a single security rule base for firewalls, threat prevention, URL filtering, application awareness, user identification, file blocking and data filtering. Panorama provides static rules in a dynamic network environment. This crucial simplification reduces your workload and provides operational OPEX savings. In addition, this enhances security because rules are easier to understand and update.
Scalable and flexible network	Flexible deployment options include hierarchical structure with device groups and log collectors that can support your business growth.
Focus on important traffic and threats	The Application Command Center (ACC) brings the benefit of valuable network visibility, automatic global reporting, and consolidation of data for actionable information about network traffic and threats across your network
Enhanced security context beyond the firewall	Panorama ingests logs from the next-generation firewall and Traps advanced endpoint protection, and automatically correlates events across the network and endpoint devices to surface threats that would otherwise remain hidden. Querying and correlation based on aggregated logs provide comprehensive visibility and insight.
Reduced dependence on manual actions	Automation features, like tagging an IP address for a policy action or triggering an action on a third-party system, allow for instantaneous responses to security incidents and reduce the number of actions that human analysts need to take.

“WE CAN VIEW GLOBAL TRAFFIC AND ACTIVITIES, CHANGE AND ISSUE RULES RIGHT AWAY. IF THERE IS A MALWARE ATTEMPT, IN ONE CLICK I CAN ADDRESS THE TARGET IP AND DISTRIBUTE THE SECURITY SOLUTION TO EVERYONE ALL OVER THE WORLD. WITH PANORAMA, WE CAN APPLY RULES AND FIXES TO EVERY DEVICE IN SECONDS.”

Islam Masoud | Security Operations Manager, OSRAM
